

FOLIOSYNE

Documents, composed.

A sample eight-page document for the in-browser studio.

- Read and search long PDFs without leaving the page.
- Edit, comment, redact, and sign — then save a real PDF.
- Convert to Word or Google Docs, and back again.
- Protect with a password. Translate a selection, a page, or the file.

Open · Annotate · Convert · Share

Reading & navigation

Foliosyne renders pages on demand, so a long report does not stall the studio. Use the zoom, fit-width, and fit-page. Page Up and Page Down walk the document; the page stack in the right leaf immediately.

Move a page up or down in the stack when the order is wrong. Rotate a single page, a typed page, or the whole file — ninety degrees at a time, or one hundred eighty.

When the pointer rests on words, it becomes a text-selection cursor. Drag to copy. Nothing switches on.

Editing, comments, signatures

Add text boxes where the original layout needs a correction. Highlight a passage. Drop a comment and write the note — every comment also lives in the side rail.

Signatures come three ways: typed full name, typed initials, or a photograph of a real signature. PNG, or WebP. White paper behind a photo is knocked out so the ink sits on the page. Save once, stamp it on any page.

Marks stay on the document until you save. Saving bakes them into a new PDF you can download or share.

Protect, redact, convert

Set an open password. Foliosyne encrypts the file with AES-256 when you save, so the next time you open it, you need to know the phrase.

Redaction is a drag rectangle. On export the cover is opaque, and redacted runs are omitted in Google Docs, and translation so the hidden words do not leak through a conversion.

Convert a PDF to Word for further drafting, or to Google Docs via a .docx plus formatted HTML. You can paste. Word files and Google Docs exports (.docx) convert the other way — into a clean PDF. You can sign and protect.

Translate & cloud

Choose a target language, then convert the current selection, this page, or the whole document translation as a text box, or copy it.

The interface itself has a language menu in the top bar: every label, tooltip, and help dialog that choice, including right-to-left Arabic.

Share downloads the file, uses the system share sheet when the browser allows it, or sends y Drive, Dropbox, Box, OneDrive, and iCloud. Printers discovered on this Wi-Fi appear in the dialog — save Home and Work labels so the destination is obvious.

Bookmarks & large files

Detect section headings automatically, or pin a custom placeholder on the page you are looking at to travel. Outlines already inside a PDF are imported when the file opens.

Thumbnails on the left keep place in a long deck. Only pages near the viewport are painted, so a hundred-leaf contract stays responsive.

Light is the default paper. Dark mode inverts the chrome, not the page ink, so proofs stay readable at night.

Keyboard shortcuts

Ctrl or Cmd with O opens a file. S saves a PDF. P prints. Plus and minus zoom; 0 fits the window and Page Down turns leaves. Escape closes a panel or cancels a drawing tool. Delete removes a mark.

Hover any tool for a short explanation. The Help panel repeats this map in the language you choose.

This sample is itself a PDF generated in the studio — save it, sign it, redact a line, translate it and convert it to Word to confirm the round trip.

Colophon

Foliosyne is an editorial name: folio, a leaf of paper; syne, together. It is not Adobe, not Acronis, not a cloud locker pretending to be a reader.

Work stays in this browser until you export. There is no account wall on the studio floor. Drive uses the Drive already connected to the Grok session when that grant exists.

Print through the operating system so home and office printers on Wi-Fi — AirPrint, IPP, standard — are the ones you already trust.

Set a language. Set a mode. Open something that matters.
